10 November 1993

This report is a work prepared for the United States Government by Battelle. In no event shall either the United States Government or Battelle have any responsibility or liability for any consequences of any use, misuse, inability to use, or reliance upon the information contained herein, nor does either warrant or otherwise represent in any way the accuracy, adequacy, efficacy, or applicability of the contents hereof.

Foreword

The following is configuration data for the McData 7100 and 6100 communications controllers located at McClellan AFB. This data has been compiled as a result of the testing efforts at Sacramento Air Logistics Center (SM-ALC) and reflects the specific changes required for SM-ALC. Installation at sites other than SM-ALC will require modification to these procedures.

There are two (2) 7100 controllers and ten (10) 6100 Ethernet controllers. These installation and configuration instructions will provide the necessary information for one of each controller.

These steps can be duplicated for the remaining controllers.

Table of Contents

Section 1.0	
McData 7100 Installation	2
Section 1.1	
Installation Procedures.....	2
Section 1.2	
Configuration Procedures.....	2
Section 2.0	
McData 6100 Installation	8
Section 2.1	
Installation Procedures.....	8
Section 2.2	
Configuration Procedures.....	8
Section 2.2.1	
Controller Terminal Configuration Procedures.....	9
Section 2.2.2	
Controller Printer Configuration Procedures	12
Section 2.2.3	
Controller TCP/IP Configuration Procedures	13
Section 2.2.4	
Controller Token Ring Configuration Procedures	15
Section 2.2.5	
Controller SNMP Configuration Procedures	16

The following list of Appendices contain information necessary to install and configure all of the controllers. Some of this data is required for each individual controller during its configuration, the remaining is global configuration information. The data must replace the data found in these procedures at the appropriate location. Configuring two controllers with the same information may result in catastrophic network or host errors. ie: assigning duplicate internet addresses, etc. The installer will be prompted in these instructions when it is necessary to supply different information.

Appendix A Host Mainframe I/O Generation

Appendix B Host Mainframe VTAM Major Node Definition

Appendix C Host Mainframe User Table Definition

Appendix D Printer Definition Matrix

Appendix E Hardware Addresses

Appendix F Ethernet Node Address Request Forms

Appendix G Overall Cable Requirements

Appendix H Overall Power Requirements

Appendix I Miscellaneous Equipment Requirements

Appendix J Configuration Blueprint

Prior to installing and configuring the McData controllers you must perform an IOCP Generation and a VTAM major node definition on the host mainframe computer for the controllers. Appendix A contains the information necessary to perform the IOCP Generation and Appendix B contains the information necessary to perform the VTAM Major node definition. This information should be given to the mainframe system programmer. Appendix C is the User Table (USSTAB) that is required for this installation. Appendix D is the printer matrix definition that was created to assist the configuration manager in supporting the printers. This matrix is not required for the installation or configuration of the 7100 or 6100 controllers. It was developed to show the correlation between the Mainframe printer definitions, the major node definition for the VPS and CICS regions, and the relationship to printers on the Ethernet network. This is a good way to control and understand the mapping relationship of the print capability from the mainframe to the user. ie: a user can provide any one of the print IDs or queue names and it can be tracked in both directions (Mainframe and Ethernet) for trouble shooting, etc.

Section 1.0 McData 7100 Installation:

Power Requirements

1-110 Volt 20 Amp outlets

Cable Requirements

1 set-IBM Bus and Tag Channel Cables

1-Token Ring Adapter Cables

Software Requirements

Channel Gateway

Token Ring Down Stream Node

Miscellaneous Equipment

1-Token Ring Media Access Unit (MAU)

You will need to energize the ports on the MAU if this is a new MAU. There is a special tool that is used to do this. Contact the MAU manufacturer to receive the special tool.

Section 1.1 Installation Procedures

Connect the IBM Bus and Tag cables to the mainframe computer.

Ensure that the channel interface on the mainframe is not active during this time

Connect the IBM Bus and Tag cables to the McData 7100 Controller.

Connect one Token Ring Workstation Cable to the Token Ring card in the 7100.

Connect the other end of the Token Ring cable to one of the ports on the MAU.

Connect an IBM 3278 model 2 terminal to one of the coax adapters on the coax card located in one of the slots of the 7100.

Section 1.2 Configuration Procedures

Turn on the coax attached terminal on the 7100 and toggle the test/operation switch. Place the terminal in test mode.

You will see the LCP Command Options menu

Enter privileged mode.

Type **<m>** and press the **<TAB>** key.

The cursor will move to the right side of the screen

Type <SYSTEM> at the prompt

A <P> and a stick man figure will appear just left of center on the status line at the bottom of the screen.

You are now in privileged mode.

The following steps will describe the configuration of the 7100 for host to 6100 gateway communications.

Type <H> on the command line and press <ENTER>.

The Host Command Options screen will be displayed.

Type <A> on the command line and press <ENTER>.

The Protocol Assignment screen will be displayed.

Select the number that corresponds to the "Local SNA" protocol option. Type this number on the command line and press <ENTER>.

Enter the number of logical units that you would like.

For this configuration only one card was supplied in the 7100 that contained four coax ports. <4> was entered for the number of logical units and the <ENTER> key was depressed.

A command accepted message will be displayed indicating that the information was entered and accepted correctly by the configuration program.

Return the cursor key to the command line and type <HP> and then press the <Erase> end of file key.

Press the <ENTER> key.

The Remote Host Ports screen will be displayed.

Type <C0> on the command line to identify the connection through the first channel controller and press the <ENTER> key.

The "Logical Port Physical Parameters" screen will be displayed.

Ensure that the parameters are as follows:

<20> for the Burst size

<00> for the UCW

<00> for the High speed transfer

<00> for the command retry

Tab down to the appropriate line and change the information as necessary. Press the <ENTER> key when you are through.

A command accepted message will be displayed indicating that the information was entered and accepted correctly by the configuration program.

Return the cursor key to the command line and type <H L> and then press the <Erase> end of file key.

Press the <ENTER> key.

The SNA Logical Parameters screen will be displayed.

Tab down to the "Host processor interface address." field and enter <10>.

This correlates to the IOCP subchannel address

Tab down to the "Physical host port identifier" field and enter <C0>.

This correlates to the Physical Parameter that was entered in the previous step.

Tab down to the "Host name" field and enter <6100D>.

This correlates to the node name that is supplied by the Ethernet network administrator.

Press the <ENTER> key.

A command accepted message will be displayed indicating that the information was entered and accepted correctly by the configuration program.

Return the cursor key to the command line and type <H C> and then press the <Erase> end of file key.

Press the <ENTER> key.

The SNA Logical Parameters screen will be displayed.

Press the <PF3> key.

The LCP Command Options screen will be displayed.

Type <H C 1> and press the <ENTER> key.

A command accepted message will be displayed indicating that the information was entered and accepted correctly by the configuration program.

Type <N P> and press the <ENTER> key.

The Token-Ring Physical Network Parameters screen will be displayed.

Ensure that the parameters are as follows:

<500011008A2E> for the override LAN address

<01> for the Enable hard error counter

<01> for the Enable soft error counter

<01> for the Enable contender

<03> for the 16Mb Token Ring release

Tab down to the appropriate line and change the information as necessary. Press the <ENTER> key when you are through.

A command accepted message will be displayed indicating that the information was entered and accepted correctly by the configuration program.

Return the cursor key to the command line and type <N P S> and then press the <Erase> end of file key.

Press the <ENTER> key.

The Local SAP Definitions screen will be displayed.

Return the cursor key to the command line and type <N M> and then press the <Erase> end of file key.

Press the <ENTER> key.

The DSPU Mapping screen will be displayed.

Tab down to the entry fields and enter the following data:

<1> for Host ID

<11> for the Host Address (this correlates to the IOCP generation Down Stream Node (DSN) subchannel address)

See Appendix E for additional Host Address numbers.

<500011008EB7> for the Token Ring LAN address.

See Appendix E for additional Token Ring addresses.

<04> for the DSN SAP

Increment this SAP in multiples of four (4) for each additional 6100.

<1> for the Device Type

<2042> for the Xmit Frame Size

<2> for the Xmit Window Size

<1> for the Rcv Window Size

Press the <ENTER> key when you are through.

A command accepted message will be displayed indicating that the information was entered and accepted correctly by the configuration program.

Return the cursor key to the command line and type <NA GW> and then press the <Erase> end of file key.

Press the <ENTER> key.

The Logical Networks screen will be displayed.

<Active> will be displayed next to the Network State field.

Return the cursor key to the command line and type <NL DSN> and then press the <Erase> end of file key.

Press the <ENTER> key.

The Token-Ring DSN Network Parameters screen will be displayed.

Ensure that the parameters are as follows:

<00200> for the Response timer

<040> for the Receive acknowledge timer.

<30000> for the Inactivity timer

<08> for the Maximum retry count

<02> for the Transmit window size

<01> for the Receive window size

<00> for the access priority

Tab down to the appropriate line and change the information as necessary. Press the <ENTER> key when you are through.

A command accepted message will be displayed indicating that the information was entered and accepted correctly by the configuration program.

Return the cursor key to the command line and type <NL GW> and then press the <Erase> end of file key.

The Token-Ring Gateway Network Parameters screen will be displayed.

Ensure that the parameters are as follows:

<00200> for the Response timer

<040> for the Receive acknowledge timer.

<30000> for the Inactivity timer

<08> for the Maximum retry count

<00> for the access priority

Tab down to the appropriate line and change the information as necessary. Press the <ENTER> key when you are through.

A command accepted message will be displayed indicating that the information was entered and accepted correctly by the configuration program.

Press the <PF3> key.

The LCP Command Options menu will be displayed.

Type <D W> and press the <ENTER> key to write the configuration to the 7100 disk.

This completes the 7100 installation and configuration instructions.

Section 2.0 McData 6100 Installation:

Power Requirements

1-110 Volt 20 Amp outlet

Cable Requirements

2-10Base2 Cables

2-BNC T connectors

1-Token Ring Workstation Cable

Software Requirements

Ethernet Communications (LAT, TCP/IP)

Token Ring

SNMP

Miscellaneous Equipment

1-Personal Computer with a serial interface and a hard drive.

Ethernet Transceiver

Section 2.1 Installation Procedures

Connect the Token Ring Cable to the Token Ring card in the 6100.

Connect the other end of the Token Ring cable to the MAU.

Connect the Personal Computer to the monitor port on the 6100. (use the Serial cable provided by McData)

Connect the BNC T connectors to the 10Base2 cable and then the BNC connector on the Ethernet cards..

Section 2.2 Configuration Procedures

Power up the Personal Computer and when it is finished booting, ensure that the c:>(root directory) prompt is displayed. If it is not, exit any applications that are running until you are returned to the root prompt.

Make a sub directory on the hard drive called netmon.

Obtain the Netmon disk supplied by the McData Corporation. (This disk came with the 6100 software).

Follow the installation procedures to install the netmon software on the hard drive.
Set a privileged password for the netmon system. (This will provide you with the
privileges to configure the 6100)

Place the system load disk in the 6100 drive a: and the utilities disk in drive b: and power up
the equipment. Observe the netmon status line on the Personal Computer. In the lower left
hand corner the message (N/C) should be displayed while the 6100 is booting. Once the 6100
finishes booting, the status should change to (CON). The configuration process can start
after the (CON) status is displayed.

Section 2.2.1 Controller Terminal Configuration Procedures

Turn to Chapter 10 in the LinkMaster 6100 LAN Applications Overview and Installation Manual
and follow the instructions in conjunction with the following instructions.

From the NETMON MAIN MENU select option Connection Control.

Select Log on to node and press the <ENTER> key.

The Log on to node window will appear.

Sign on to the netmon system using the password that you set up previously.

Select the Hardware Path Configuration from the main menu.

The Hardware Path Configuration menu will be displayed.

Select the Node ID assignment option

The Node ID assignment screen will be displayed.

Enter Node ID <1> and press the <CTRL><ENTER> keys simultaneously.

The input will be accepted.

Press the <PF3> key to return to the Hardware Path Configuration menu.

Select the Ethernet Port Parameters option

The Ethernet Port Parameter menu will be displayed.

Select the Add option.

Enter the following information for the parameters listed:

Port ID = <1>

There are two Ethernet cards per controller.

This is the port that the Ethernet card is physically located in the 6100. ie: 1 or 2

Address = <08 00 88 00 39 36>

This is the Ethernet address of the Ethernet card that is installed in the 6100.

There are two Ethernet cards per controller. See Appendix F for the additional Ethernet addresses.

Application interface = <LAT, TCP, UDP>

(This will provide LAT, and Telnet connections from the Ethernet to be serviced at the 6100 and translated and passed through to the IBM mainframe computer.)

Press the <CNTL><ENTER> keys simultaneously.

The input will be accepted.

Press the <PF3> key to return to the Hardware Path Configuration menu.

Select the Application Configuration option.

The Application Configuration menu will be displayed.

Select the Ethernet Configuration option.

The Ethernet Configuration menu will be displayed.

Select the Logical Unit Configuration option.

The Logical Unit Configuration menu will be displayed.

Select the Logical Unit Assignment option.

The Logical Unit Assignment menu will be displayed.

Select the Add option.

Enter the following information for the parameters listed:

Host ID = <1>

LU list = <2-118>

This refers to the number of logical units that will be assigned the same following parameters.

Pool ID = <0>

This assigns the previously defined LUs to the same group.

LU type = <2>

This is the LU definition that the IBM host recognizes as a terminal.

Model = <2>

This describes the screen size characteristics of the terminal that has been defined. A model 2 terminal has a screen size of 24*80 characters.

Attributes = <Y>

This parameter sets enhanced screen mapping characteristics such as bold, highlighting, and underscore for Telnet, TN3270, and LAT terminals.

Press the <CNTL><ENTER> keys simultaneously.

The input will be accepted and the screen will be refreshed.

Section 2.2.2 Controller Printer Configuration Procedures

Enter the following information for the parameters listed:

Host ID = <1>

LU list = <119>

This refers to the number of logical units that will be assigned the same following parameters.

Pool ID = <1>

This assigns the previously defined LUs to the same group.

LU type = <1>

This is the LU definition that the IBM host recognizes as a printer.

Model = <2>

This describes the print size characteristics of the printer that has been defined. A model 2 printer has a print size of 24*80 characters.

Attributes = <N>

This parameter sets enhanced screen mapping characteristics such as bold, highlighting, and underscore for printers.

Press the <CNTL><ENTER> keys simultaneously.

The input will be accepted and the screen will be refreshed.

Press the <PF3> key to return to the Logical Unit Configuration menu.
Select the Logical Unit Application Parameters option and press <ENTER>.

Enter the following information for the parameters listed:

LU Inactivity timer value = <0>

(This will set the timeout value for no timeout)

Terminal Profile name = <vt220>

(This sets the default terminal profile to a DEC vt220 terminal. Others may be chosen.)

Press the <CNTL><ENTER> keys simultaneously.

The input will be accepted.

Press the <PF3> key to return to the Logical Unit Configuration menu.

Select the Logical Unit Pool Assignments option and press <ENTER>.

Enter the following information for the parameters listed:

Pool ID = <1>

Print Class = <all>

Response Timer = <10>

Print Compression = <never>

Printer Control = <post form feed>

Character set = <primary>

Profile name = <hpjet>

Application Type = <TCP/IP>

Host Name of Internet Address = <137.243.50.3 or the print spooler address>

Host Print Queue Name = <Print queue name on the Host>

Print Banner = <Y>

Host port for Print Daemon = <TCP host port number of the line printer daemon. The default is 515.>

Press the <CNTL><ENTER> keys simultaneously.

The input will be accepted and the screen will be refreshed.

Press the <PF3> key to return to the Logical Unit Configuration menu.

Press the <PF3> key to return to the Ethernet Configuration menu.

Section 2.2.3 Controller TCP/IP Configuration Procedures

Select the TCP/IP Application Configuration option and press <ENTER>.

Select the Address Assignments(INTERNET) option and press <ENTER>.

Select the Add option and press <ENTER>.

Enter the following information for the parameters listed:

Port ID = <1>

INTERNET Address = <137.243.172.1>

This is the INTERNET address that was assigned to the controller by the network administrator. See Appendix F for Additional Internet Addresses.

Subnet Mask = <255.255.254.0>

This is the subnet mask that was assigned to the controller by the network administrator.

Press the <CNTL><ENTER> keys simultaneously.

The input will be accepted and the screen will be refreshed.

Press the <PF3> key to return to the TCP/IP Application Configuration option and press <ENTER>.

Select the Protocol Parameters (INTERNET) option and press <ENTER>.

Select the Add option and press <ENTER>.

Enter the following information for the parameters listed:

Broadcast address flag = <1>

Subnet mask flag = <no>

IP Datagram live time = <255>

IP packet length = <1500>

NL service type = <00>

Press the <CNTL><ENTER> keys simultaneously.

The input will be accepted and the screen will be refreshed.

Press the <PF3> key to return to the TCP/IP Application Configuration option and press <ENTER>.

Select the Gateway Address Assignments(INTERNET) option and press <ENTER>.

Select the Add option and press <ENTER>.

Enter the following information for the parameters listed:

Gateway ID = <1>

Gateway Address = <137.243.173.244>

Internet Address = <0.0.0.0>

Subnet Mask = <0.0.0.0>

Press the <CNTL><ENTER> keys simultaneously.

The input will be accepted and the screen will be refreshed.

Press the <PF3> key to return to the TCP/IP Application Configuration option and press <ENTER>.

Select the File Transfer Protocol Parameters option and press <ENTER>.

Select the Add option and press <ENTER>.

Enter the following information for the parameters listed:

Host ID = <1>

Inactivity Timer = <10>

OS Type = MVS/TSO

Press the <CNTL><ENTER> keys simultaneously.

The input will be accepted and the screen will be refreshed.

Press the <PF3> key to return to the TCP/IP Application Configuration option and press <ENTER>.

Press the <PF3> key to return to the Ethernet Configuration menu.

Press the <PF3> key to return to the Application Configuration menu.

Section 2.2.4 Controller Token Ring Configuration Procedures

- 1 Select the Token Ring Network Configuration option and press <ENTER>.
- 2 Select the Host Parameter Assignment option and press <ENTER>.

Enter the following information for the parameters listed:

PU ID = <1>

Gateway LAN Address = <500011008A2E>

Gateway SAP = <04>

Receive frame size = <2042> bytes

Transmit frame size = <521>

Receive window = <1>

Transmit window = <2>

XID = N/A (This will display 13D26 H however)

Host name = <6100D>

Press the <CTRL><ENTER> keys simultaneously.

The input will be accepted and the screen will be refreshed.

Press the <PF3> key to return to the Token Ring Network Configuration menu.

Select the Network Parameter Assignment option and press <ENTER>.

Enter the following information for the parameters listed:

Local LAN Address = <500011008EB7>

See Appendix E for the Token Ring Addresses for the rest of the controllers.

PU0 SAP = <04> Hex

PU1 SAP = <00> Hex

Hard Error Flag = <Y>

Soft Error Flag = <T>

Contender Flag = <Y>

Ring Speed = <16Mb>

Response Timer = <200ms>

Receive ACK Timer = <40ms>

Inactivity Timer = <30000>

Maximum retries = <8>

Access Priority = <0>

Press the <CNTL><ENTER> keys simultaneously.

The input will be accepted and the screen will be refreshed.

Press the <PF3> key to return to the Token Ring Network Configuration menu.

Press the <PF3> key to return to the Application Configuration menu.

Select the Application Configuration option and press <ENTER>.

Section 2.2.5 Controller SNMP Configuration Procedures

Select the SNMP Configuration option and press <ENTER>.

Enter the following data for the parameters listed.

Community Name = <Public>

Internet Address or Host Name = <137.243.166.5>

Flag = <W>

Contact Information = <Richard Cooper>

Domain Name = <mcclellan.af.mil>

Physical Location = <BLD600>

Press the <PF3> key to return to the Application Configuration menu.

Select the Network Management Control option and press <ENTER>.

Select the Write Configuration File option and press <ENTER>.

IML the 6100D controller.

You should now be able to connect to the IBM mainframe computer.

You may have to have a mainframe operator vary the nodes active in order for the controllers to start communicating with the host mainframe.

Also if that does not work, vary the nodes inactive, shut off everything, and then do the following:

Turn on the 7100 and wait until you see the 7100 on the status display.

Turn on the 6100 and wait until the status and disk lights go out.

Vary the nodes active and online on the Mainframe.

There were several Appendices listed at the beginning of this document that were not referenced during the installation and configuration procedures. The following is a description of those Appendices and where they are required.

Appendix G Overall Power Requirements

This Appendix lists the total power requirement necessary for the installation of the 7100s and the 6100s. This information was used in the planning stage of the controller implementation.

Appendix H Overall Cable Requirements

This Appendix lists the total cable requirement necessary for the installation of the 7100s and the 6100s. This information was used in the planning stage of the controller implementation.

Appendix I Miscellaneous Equipment Requirements

Miscellaneous equipment requirements include all items that are necessary to install and configure the controllers, but not necessarily required for the sustenance of the network.

Appendix J Configuration Blueprint

This Appendix contains the blueprint of the total installation within the computer room at McClellan AFB.

APPENDIX A

**** TSO FOREGROUND HARDCOPY ****

DSNAME=IPO1.GENLIB

(AL309011)

TITLE 'AL309011 - I/O GEN MACROS'

* AL309011
*
* THIS IS THE SM-ALC I/O CONFIGURATION COPIED FROM THE XA 2.1.3
* WR309006 MEMBER. USED FOR XA 2.2 "MVSCP" JOB IN IPO1.GENLIB.
* AL309011 CONTAINS MACROS WHICH DEFINE THE I/O CONFIGURATION.
* AL309011 MAY BE USED AS INPUT TO THE ICPIOCP PROGRAM TO CREATE
* A NEW IOCDS. THE MACROS CONTAINED IN THIS MEMBER ARE:
* IOCONFIG (NEW FOR XA 2.2)
* ID
* CHPID
* CNTLUNIT
* IODEVICE
* UNITNAME
--> CONSOLE (DELETED-HANLED BY SYS1.PARMLIB (CONSOLXX) <--
NIPCON (NEW FOR XA 2.2)

(JRR - 07/14/87)

EJECT

* CHANGE HISTORY

* 09/09/93 (JRR)

1. ADD DEFINITIONS FOR HITACHI 7990/7390 DASD. UNIT ADDRESSES ARE*
100-13F, OFF CHPS 01 AND 16. SEE TAGS CTL010 AND DEV100.*
2. ADD NEW UNIT ADDRESSES TO UNITNAME MACROS FOR DASD DEVICES.*

* 01/03/89 (JRR)

1. ADD 3990/3380/AK4/BK4 DASD DEVICES FOR CDMS. UNIT ADDRESSES ARE*
F40-F4F, OFF CHPS 0F AND 11.*
2. ADD ANOTHER SUBCHANNEL ADDRESS FOR THE COMTEN. THIS WILL BE THE*
COMTEN UTILITY LOAD ADDRESS (F10).*

* 06/06/90 (SNT)

3. ADD 3990/3380/AK4 DASD DEVICES FOR CDMS/SCD. UNIT ADDRESSES*
ARE F50-F5F ON CHPS 18 AND 1D (F50-F53 TO BE INSTALLED*
IN 3Q90).*

* 09/13/90 (SNT)

4. GENNED F52-F53 AS SYSDA

* 10/13/90 (SNT)

5. RE-GENNED F42, F43, F45 FROM 'TEMP' TO 'WORK'

* 10/17/90 (SNT)

6. ADDED F30-F37 CTC EXTENDER TO RDB

* 11/15/90 (SNT)

- 7. CHG ADDRESSES 800 TO 400 ON CHN 08.
- * 8. ADDED ADDRESSES 920-92F & 930-93F TO CHN 09, 0D, 17, 1C.
- 9. ADDED NEW CHN 12 W/ ADDRESSES 800-8FF AS 7171'S
- 10. GENNED 3390'S AT CHN 0F, 11, 18, 1D. ADDRESSES F40-F7F.
- * 11. ADDED NEW CHN 13 W/ ADDRESSES D00-DFF AS 7171'S

* 11/28/90 (SNT)

- * 12. CHG PROTOCOL=S4 ON CNTLUNIT MACROS FOR 3480'S (600-61F)
FOR 4.5 MB CHANNEL SPEED
- 13. ADD FEATURE=COMPACT TO IODEVICE MACROS FOR 3480'S (600-61F)

* 11/08/91 (SNT)

- * 14. ADD ELC2 TO CHANNEL 0E, DEFINED AS CTC, NEW ADDRESS E02

* 8/06/92 (SNT)

- * 15. REMOVED F40-F7F FROM UNIT=WORK TO MOVE DS OFF OF WORK4-7 PACKS

APPENDIX G

This Appendix contains the cable required for the McData installation at McClellan AFB.
This data is required for installation.

NOTE

See Appendix J for a diagram of the equipment and cable layout.

Type Cable	Qty	Description
10 Base 2 Coaxial	20 sections	These are standard Thinwire ethernet segments that form the physical network that the McData controllers exist on.
Serial RS232	1 ea	This is a standard 25 pin D connector (male on one end, female on the other) serial cable for connecting the Personal Computer to the McData controllers.
Serial RS232 Modem Cable	1 ea.	This is a standard serial modem cable for connecting the supplied modem to the serial port of a McData controller.
IBM Bus and Tag cable (IBM type Blue)	1 set	The IBM Bus and Tag cables are used to connect the McData 7100 controllers to the Mainframe computer.
IBM Token Ring Patch Cable	2 ea.	The IBM Token Ring patch cable is used to connect the two MAUs together. They contain standard IBM patch cable connectors on both ends of the cable.
IBM Token Ring Workstation Cables	10 ea.	The IBM Token Ring Workstation cable assembly is used to connect the McData controllers to the MAUs. These cables have a 9 pin D connector at one end and a standard IBM patch cable connector at the other end.

APPENDIX H

This Appendix contains the overall power requirements for the McData installation at McClellan AFB.
This data is required for installation.

Note

These devices do not require dedicated or isolated circuits.

Type Device	Power Required	# of devices and outlets required
McData 7100	120 volt / 15-20 ampere	1 outlet per device, 2 devices = 2 outlets
McData 6100	120 volt / 15-20 ampere	1 outlet per device, 10 devices = 10 outlets
Personal Computer	120 volt / 15-20 ampere	1 outlet per device, 1 device = 1 outlet
Personal Computer Monitor	120 volt / 15-20 ampere	1 outlet per device, 1 device = 1 outlet
Modem	120 volt / 15-20 ampere	1 outlet per device, 1 device = 1 outlet

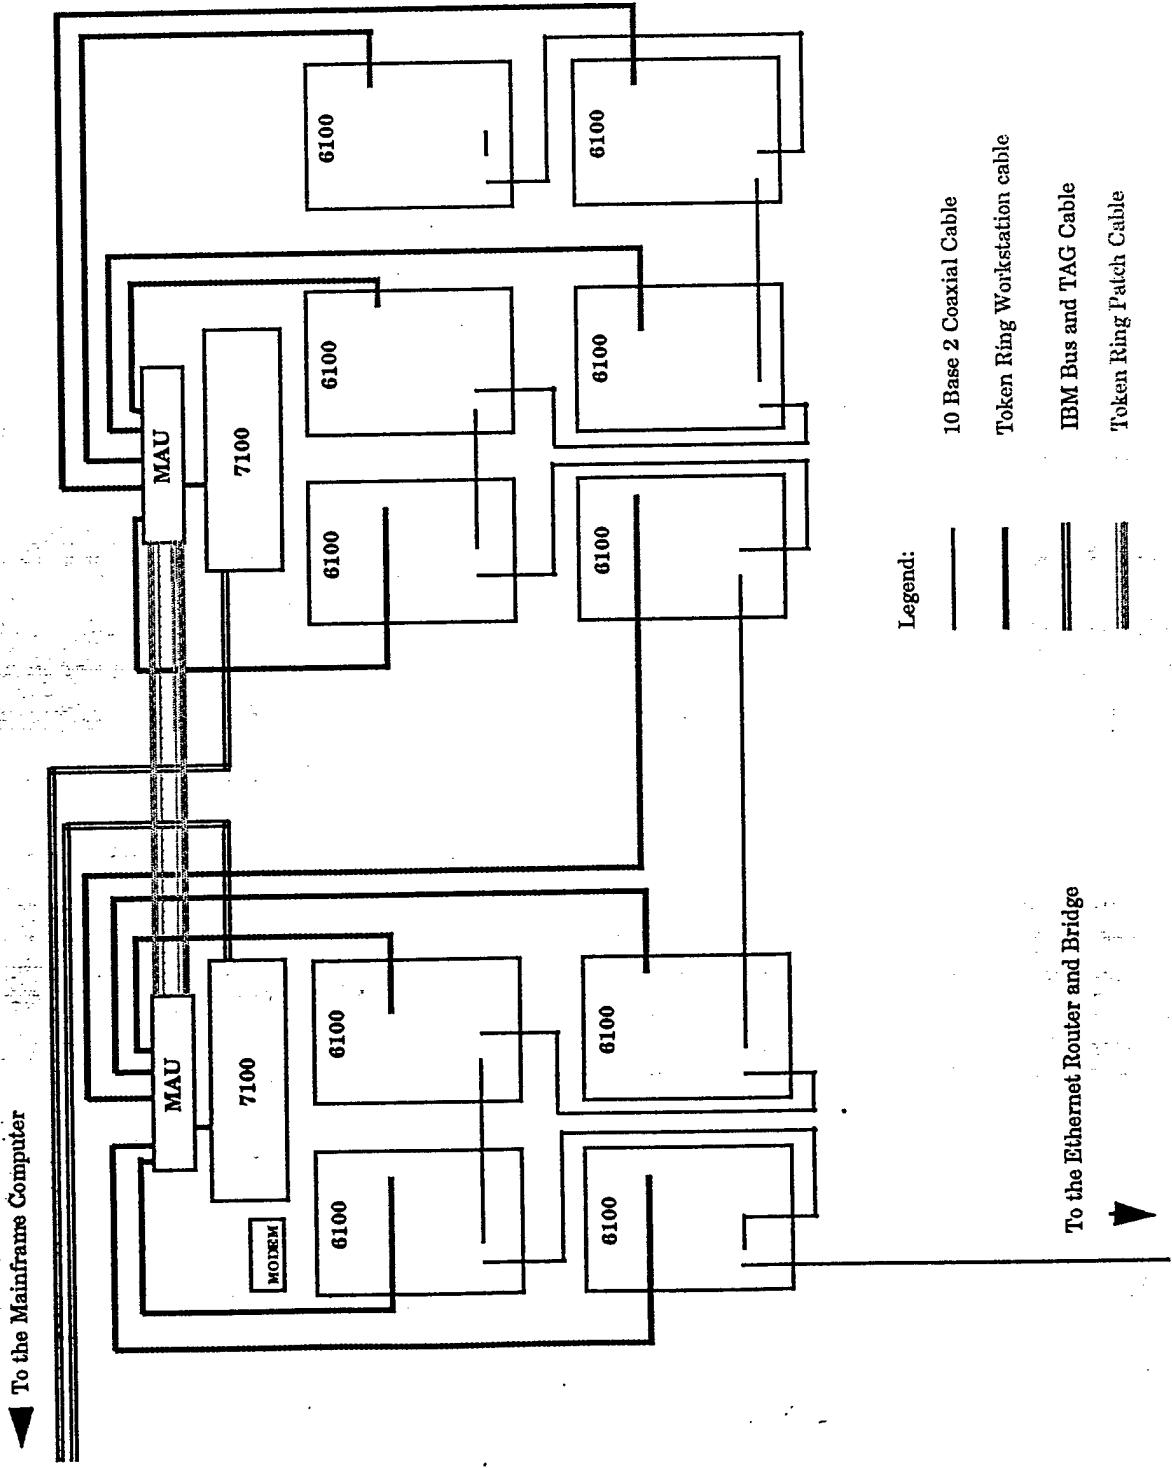

APPENDIX I

This Appendix contains a list of miscellaneous equipment required for the McData installation at McClellan AFB. This data is required for installation.

Type Device	Description
Personal Computer	A standard IBM PC compatible computer 80286 - 80486 processor. Must have 3.5 inch floppy drive and a harddrive with 2 megabytes of storage available.
VGA PC Monitor	A standard VGA monitor for the PC.
Token Ring Energizer	This is a special tool required to energize the ports on a new token ring MAU (media attachment unit). This tool is only required if the MAU is new. This process need only take place one time.
Modem	A standard modem with a serial interface. One is provided with each McData controller. Follow the instructions in the McData LinkMaster 6100 LAN Applications Overview and Installation Manual.
LAN Cable tester	This is a LAN Cable test device that can verify a section of Ethernet cable for shorts, opens, and general working condition.
Transceiver	Two Ethernet transceivers were required for this installation. These devices permit connectivity to an external device on the network. ie: a bridge, router, test device, etc that does not have a transceiver built in. For this installation, one transceiver was connected to a bridge and the other was attached to a router in the bldg. 600 computer room.

APPENDIX J

This Appendix provides a diagram of the McData installation at McClellan AFB.

APPENDIX D

The following Appendix is the printer matrix definition that was created to assist the configuration manager in supporting the printers. This matrix is not required for the installation or configuration of the 7100 or 6100 controllers. It was developed to show the correlation between the Mainframe printer definitions, the major node definition for the VPS and CICS regions, and the relationship to printers on the Ethernet network. This is a good way to control and understand the mapping relationship of the print capability from the mainframe to the user. ie: a user can provide any one of the print IDs or queue names and it can be tracked in both directions (Mainframe and Ethernet) for trouble shooting, etc.

VTAM Major Node Name	VTAM LU Name	Mainframe Host Printer ID - VPS/CICS	Ethernet Print Queue Name

APPENDIX E

This Appendix is provided to show the hardware addresses of McData 7100 and 6100 controllers for both the Token Ring and Ethernet . This information is required during the installation and configuration of the hardware and software. The format for this appendix, from left to right, is as follows:

- VTAM Major Node Definition
 - This is the name of the controller as the Mainframe host knows it. This will provide traceability for the Mainframe systems person down to the controller.
- Controller Type
 - This is whether or not the controller is a 7100 or a 6100
- Token Ring Address
 - This is the hardware address of the Token Ring card that is in the controller
- Ethernet Address
 - This is the Hardware address of the Ethernet card(s) that is/are in the controller
- IP Address
 - This is the INTERNET Protocol address that has been assigned by the local network administrator at McClellan AFB
- Hostname
 - This is the name of the controller that has been assigned by the local network administrator at McClellan AFB.

This is the name that a user would use to establish a connection to the Mainframe host.

****NOTE****

There is no LAT service name provided for any of the controllers. The LAT service name for all of the controllers is SCDAA. There is only one required since LAT has the capability to load balance dynamically across all of the controllers. ie. *The first user gets placed on the first controller, the second to the second etc. This is repeated until all of the controllers have a user on them. The very next user is then placed back on the first controller and the process is repeated again.*
